

PRESS RELEASE

Date: 24 July 2022

Top-drawer condition monitoring provided by WearCheck

Minimised downtime, lower maintenance bills, enhanced component availability and lifespan, more savings on the bottom line and boosted productivity – these are just some of the added value factors that a world-class condition monitoring programme can bring to an industrial operation.

WearCheck is well positioned to offer just such a programme to sectors such as mining, automation, manufacturing, wind turbines and power generation, earthmoving, industrial, transport, shipping, aircraft and electrical operations.

We provide condition monitoring services throughout Africa, the Middle East and India – our network of 14 laboratories spans the continent and beyond, with a presence in nine countries.

As the market leader in several arenas - including testing and analysis, asset reliability care and lubricant-enabled reliability services - WearCheck ensures the health of key assets such as engines, turbines, and all industrial components.

Our experienced diagnosticians and scientists analyse used oil from mechanical and electrical systems, transformer oil, water, fuel, greases and more, effectively processing over 800 000 samples per annum.

Furthermore, our lubricant-enabled reliability (LER) technicians offer advice and products to enhance an operation's lubricant management systems and assists companies to develop and implement bespoke LER programmes.

LER encompasses all lubrication-related activities that improve equipment reliability and asset optimisation, such as the design and construction of lube rooms, on-site lubrication surveys, lubricant storage, handling and dispensing and well as filtration.

Our asset reliability care (ARC) division offers services such as reliability solutions (balancing, vibration monitoring, alignment and more) and advanced field services (rope testing, technical compliance, non-destructive testing).

Our leading ARC technicians have amassed 100+ years' experience in proactive maintenance techniques such as advanced vibration analysis, infrared, non-destructive testing (NDT), alignment, balancing and more on 10,000+ machines.

There are WearCheck laboratories in South Africa, Namibia, Zimbabwe, Zambia, Mozambique, Ghana, DRC, Dubai and India, supported by regional offices in several other African countries.
